UV PASTE

PASTE BAIT FOR RODENT MONITORING

Without active substance

Formulation with a fluorescent tracer allowing the detection of urine under a UV light

INSTRUCTIONS FOR USE:

The use of this type of non-poisonous bait is recommended in the following situations:

- when you suspect, without being sure, the presence of rodents
- after a pest control campaign, to ensure that there is no more infestation
- in areas where the use of poison is not possible, look for pathways of rodents in buildings to place the bait

Use bait points of 25g to 50g per bait point and regularly check the consumption.

No consumption: continue to check regularly and renew the placebo when it dries.

Consumption: remove the placebo then treat with a rodenticide product.

AN ADVANTAGE OF USING PLACEBO BAIT

Regular use of placebo bait avoids the use of large quantities of poisonous bait and helps identify the target past.

Pre-baiting with placebo baits reduces mistrust rodents and strengthens dramatically the implementation of poisoned baits.

PRECAUTIONS

UV PASTE does not contain any active substance.

Paste monitoring is not a foodstuff.

Keep away from the reach of children and animals.

Batch No:

Pack size: 4KG
