STOP Rodent Infestations

on your farm
in 5 simple steps

- ✓ Monitor
- ✓ Control
- ✓ Prevent

Best practices to prevent and control a rodent infestation on your farm in-line with CRRU guidelines and Farm Assurance schemes

5 Steps to Stop Rodent Infestations

1

Monitor Rodent Activity Regularly

Checking for rodent activity all year round is key to keeping the risk of infestations low. Carry out a brief inspection every week to check for signs of activity:

- Rat burrows under buildings
- Loop smears on beams or rafters
- Rat holes in dirt banks, damaged doors, holes or entry points
- Runs on the ground between potential feeding areas
- Droppings in ventilation ducts, next to food and equipment stores

Lodi's non-toxic UV Blocks and UV Paste will aid you as a monitoring feed to confirm rodent activity before baiting.

UV Blocks and Paste are formulated with a UV tracker that causes rodent urine to glow, allowing you to trace where the rodents are hiding and control them quickly.

3

Limit Potential Food Sources

Farms should be kept clear of food sources whenever possible. Spillages lying around can allow the rodent to feed away from the rodenticide and may cause efforts to control infestations to be ineffective.

- Use a non-toxic UV tracker near to feeding areas to monitor activity - if rodent activity is evident, replace monitoring with Gems rodenticides

2

Bait with Lodi Gems Rodenticides

Rodenticides such as the Lodi Gems range is the most successful way to control rodent infestations when they occur. For farmers looking to use Gems to control their rodent populations, there are a few things to know:

- Lodi UK provides e-learning courses with Lantra. If you don't have CRRU approved Farm Assurance certificates such as Red Tractor, the course enables you to purchase professional rodenticide pack sizes of 3kg and above
- Bait in and around key areas across the farm: buildings, drains, sewers, and feed stores

Gems

Choose the right formulation for your needs:

- Ruby and Jade Bait, containing Difenacoum and Bromadiolone, are best to use first when approaching a rodent problem, following CRRU guidelines and Farm Assurance schemes
- Sapphire Bait is designed to solve the toughest rat and mouse infestations. As a single-feed poison containing Brodifacoum, it delivers a lethal dose in one feed
- Black Pearl, containing Alphachloralose, is specifically formulated to control mice fast, working in under 24 hours

Prevent resistance build-up towards a specific bait and keep rodents interested in eating them, change the active ingredient of your rodenticide periodically (Ruby, Jade, Sapphire).

4

Keep the Farm Tidy

Rubbish and waste (whether organic or man-made) around a farm are an ideal place for rodents to shelter and remain out of sight from both farmers and natural predators.

- Maintaining a tidy farm and clearing food spillages is essential to rodent control

5

Proof Farm Buildings

Proofing buildings, machinery, wiring, and other areas around the farm from rodents is essential.

- Proof areas, use wire mesh and fill any holes on the ground and in drains and sewers, protect cabling with an anti-rodent spray and use physical barriers to stop entry

Gems

Lodi's Gems will solve your rodent infestations fast and effectively.
