

# Pest Problems Pig Solutions

Complete product guide for  
protecting Pigs & Farms from pests

## Rodent Solutions

Rodents pose significant risks to pig farms, spreading diseases like leptospirosis and salmonellosis, contaminating feed, and causing costly damage to infrastructure by chewing wires and insulation. They can also attract predators, leading to more health issues. Swift action is crucial, and effective rodent control with quality rodenticides can protect your pigs and operations from these persistent threats.

Lodi UK offers the perfect all-in-one solution to tackle these rodent problems. Our **Gems range** features three powerful anticoagulant actives: **Brodifacoum**, a single-feed bait and multi-feed baits Bromadiolone and Difenacoum - available in grain, paste, and block formulations to suit any farms needs. For those worried about secondary poisoning, **Lodi Harmonix** uses the innovative Cholecalciferol, controlling rodents in half the time with reduced risk of secondary poisoning to non-target species..

For fast-acting mouse control, **Black Pearl** delivers results in under 24 hours. If you have a rodent problem, Lodi UK has the solution.

- Rodents spread diseases like leptospirosis and salmonellosis
- Mice are incontinent - a colony contaminates far more than it eats
- Difenacoum has the highest LD50 in pigs
- Secondary poisoning occurs when a non-target animal eats the carcass of a laced rodent

## Rodent Proofing

Once rodent control is established, keeping the area rodent-free is vital to prevent future infestations. Rodent proofing buildings, eliminating clutter, and maintaining bait stations or snap traps are essential steps. Our durable bait boxes, traps, and rodent proofing solutions offer long-term protection, ensuring rodents can't return to damage your farm or spread disease. Our high-quality, tamper proof rodent bait stations are designed to perfectly complement our range of leading rodenticides. We offer snap traps, live capture traps and rodent proofing sealants and deterrent sprays as part of our chemical-free rodent control portfolio.

- Our snap traps are used by professional pest controllers with highly durable springs
- Bait stations are a legal requirement for baiting around buildings with anti-coagulants
- Use traps or monitoring baits to ensure you are on top of infestations quickly

## Fly Solutions

Flies can significantly impact pig farms by spreading many diseases, including E. coli, African Swine Fever and Porcine Reproductive and Respiratory Syndrome. They also carry parasites like tapeworms and cause stress, pain, and blood loss, all of which reduce pigs' growth rates. Fly infestations drive up operational costs and delay the time it takes to bring pigs to market which can cost approximately £15,000 per 1,500 pigs in additional feeding, labour and housing costs.

To combat this, a proactive approach to fly control is essential. Lodi's range of products provides a comprehensive solution: **Organ-X Pro-Formula Fly Trap XL** captures and monitors fly populations, while larvicides like **Maggots** and **Larvenol** prevent flies from maturing. For lasting control, **Perbio Choc RTU** offers up to three months of residual protection. Pairing these with fast-acting fly baits like **Twenty One** and **Sheila** ensures farmers can effectively manage fly infestations, keeping their livestock healthy and operations running smoothly.

- A female house fly can lay up to 500 eggs
- Irritation and distraction by flies can lead to a 12 day increase in finishing pigs
- Pig husbandry offers 5\* accommodation for flies
